                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (010 Aggadesierrecerreceadesececeradadesecerecirecerrecirecedesece 951
                                                                                  The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (AB266670-AB266613), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABP99207-AB269362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eveninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene fragment. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins becardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AGCGAGTTCAGCAGGCGAAGACAGGTCGGTGCGGATGCCCTCGACGTCGGCGGGGGGAACC 499

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          261
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABL50555 to ABL50562 represent contigs 1 to 8 from the Micromonospora carbonacea everninomicin biosynthetic locus gene cluster. The contigs encode the protein sequences designated ORF (open reading frame) 1 to 49, given in ABB06881 to ABB06930. The gene cluster is useful for the construction of the everninomicin antibiotic in overproducing strains, and to allow chemical modifications of everninomicin to enhance certain properties via genetic manipulation or combinational biosynthesis. The gene cluster can be used to produce genetic systems and genese encoding novel enzyme activities, and avoid the problems of low yield and quality of everninomicins produced by chemical synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  382 GICACGGIGGCGCTCTICGCCGTCGCGCGGTACGCCACCCCGCTIGCCCTCGGCCTTG 441

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ666813), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABP99207-ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eventinomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both eventinomicin-type orthosomycins and avilamycin-type orthosomycins) regarded by the organism or the amount of orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying orthosomycin biosynthetic gene, gene fragment or gene cluster, by detecting presence of nucleic acid sequence corresponding to 17 of flambamycins protein families.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 382 GTCACGGTGGCGCTCTTCGCCGTCGCGCCGTACGCCACCCGCCTTGCCCTCGGCCTTG 441
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ6660-0-ABZ66613), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABP99207-ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both everninomicin-type orthosomycins daylamycin-type orthosomycins (both everninomicin-type orthosomycins production are expressed by the organism or the amount of orthosomycin production are expressed by the organism or the detection of new orthosomycin natural products, not produced by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying orthosomycin biosynthetic gene, gene fragment or gene cluster, by detecting presence of nucleic acid sequence corresponding to 17 of flambamycins protein families.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7944 AGACCATGCAGCATCTTGACGAGTTCGTCGCGGTGCGCCCGCACGTTGTCGGCGAACC 7887
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             442 AGCGAGTTCAGCAGGGCGAGCTCGGTGCGGATGCCCTCGACGTCGGCGGCGAACC 499

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to avilamycin derivatives (I) with antibacterial, virucide, protozoacide and fungicide activity. (I) are useful for treatment of infections (Dacterial, viral, protozoal or fungal), in human or veterinary medicine, particularly where caused by Staphylococus aureus. (I) are more hydrophilic than known avilamycins. The present esquence is that of a nucleic acid encoding avilamycins synthesis enzymes from the Streptomyces viridochromogenes Avilamycin A biosynthetic gene cluster (ABZ37515-ABZ37516)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          182 CCCGGCGGAACTCCTGCTCCTTCGCCATGATCTCGTCGGCGTGGTTCCAGGCGAAGAGCA 241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            315
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ666813), comprising detecting the ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both everninomicin-type orthosomycins and avilamycin-type orthosomycins) regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying orthosomycin biosynthetic gene, gene fragment or gene cluster, by detecting presence of nucleic acid sequence corresponding to 17 of flambamycins protein families.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13 6 CTCGTCACGTGTACGCGGGGACGTACAGGATCCACTGTCCGCCAGCCCGGCGGAACTCC

(I) are useful for treatment of infections (bacterial, viral, protozoal or fungal), in human or veterinary medicine, particularly where caused by Staphylococcus aureus. (I) are more hydrophilic than known avilamycins. The present sequence is that of a nucleic acid encoding avilamycins. The present from the Streptomyces viridochromogenes Avilamycin A biosynthetic gene cluster (ABZ37515-ABZ37516)
                                                                                                                                                                                                                                              361

```
The invention relates to avilamycin derivatives (I) with antibacterial, virulide, protozoacide and fungicide activity. (I) are useful for treatment of infections (bacterial, viral, protozoal or fungal), in human or veterinary medicine, particularly where caused by Staphylococcus aureus. (I) are more hydrophilic than known avilamycins. The present exquence is that of a nucleic acid encoding avilamycin synthesis enzymes from the Streptomyces viridochromogenes Avilamycin A biosynthetic gene cluster (ABZ37515-ABZ37516)
                                                                                                                                                                                                                                                                                                          infection;
                                                                                                                                                                                                                                                                                                      Avilamycin; antibacterial; virucide; protozoacide; fungicide; infect: medicine; Staphylococcus aureus; biosynthetic gene cluster; gene; ds

                                                                                                                                     The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (AbZ66670-AbZ666813), comprising detecting the presence of a mucleic acid sequence coding for a polypeptide (AbB99207-AbB99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eventionation type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of presence of any organism that contains DNA for the production of production are expressed by the organism or the amount of orthosomycin production are expressed by the organism or the amount of orthosomycin production are expressed by the organism or the detection of new orthosomycin natural products, not produced by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /*tag= b

The present sequence represents the 2.1kb BglII fragment of Streptomyces longisporoflavus R19 which is involved in the biosynthesis of indolecarbazole alkaloids (ICA). The sequence contains two functional fragments is indicated in the features table. The DNA or a hybrid vector containing it can be used to prepare an ICA or derivatives and precursors, either by allowing production in previously incapable organisms or by improving vields. In particular, the antibiotic staurosporin can be produced. Staurosporin is known to have inhibitory activity against fungi, yeasts, and Ca2+/phospholipid-dependent serine/threonine protein kinases (PKCS). Staurosporin also has antiproliferative activity and can inhibit platelet aggregation. The present sequence can also inactivate ICA biosynthesis genes and can be used in PCR amplification. An advantage of this is that protuctivity of staurosporin-synthesising Streptomyces is improved over natural strains yielding only low concentrations. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 AGTOCOGOTAGACOGTOGOCOCOGAAGGCGTACGCGCCTTTCGACGGTCAGCGGGCGGGCGG 120

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the
polypeptides that are not from the avermectin biosynthetic pathway to effect the synthesis of a pharmaceutically active compound, e.g. an antibiotic. The present sequence represents the 10 kb genomic fragment that contain genes involved in the synthesis and/or addition of oleandrose to avermectin aglycones
                                                                                                                                                                                                                                                       6248 cercecegaacaceircecercaartreacecececerceaceaceaceaceaeceaece

                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a 10 kb genomic DNA isolated from S. avermitilis that contains genes encoding proteins for glycosylation of avermettin aglycomes. The polypeptides can be expressed by standard recombinant methodology. The gene and the encoded polypeptides together with other portmatically active polypeptides, are useful to perform combinatorial biocatalysis in vitro and in vivo in a host cell. They are useful for performing biotransformations on macrolide compounds including avermectin or other macrolide agiycones. The sequences are also useful in vivo in a bacterial host, in vitro in combination with an actinomycete fermentation, and in vitro in combination with enzymatically active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acid fragments of Streptomyces avermitilis genome useful for enzymatic, biochemical, biosynthetic and diagnostic purposes.

```
cc antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confidention; (8) identifying a compound that inhibits proliferation; (8) identifying a gene required for cellular proliferation of the biological pathway in which a proliferation-required gene or its gene product lies confidentifying a gene on which the test compound that inhibits proliferation of an corganism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound that inhibits the corporation of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the compound of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational curred is scovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in cellectronic format directly from MIPO at

The present sequence is given in a specification relating to the structure and function of a regulatory gene, SCARECROW (SCR). SCARECROW-CC Structure and function of a regulatory gene, SCARECROW (SCR). SCARECROW-CC Similar to the sequence of MOTIF III (WIIID) of Arabidopsis SCR protein are disclosed. SCR and SCL genes are useful for producing transgenic plants whose cell division is modified and root and/or stem development and gravitropism of stem or hypocoryl is allered. Cell division is conceased or decreased in roots resulting in thicker or thinner root development. The transgenic plants are useful for expressing a gene of increase encoding a gene of cincrease encoding a gene of cortal plants are useful for expressing a gene of cortal plants in shoots. The SCR gene also confers less susceptibility to lodging in the transgenic plants than a wild-type conceptibility to lodging in the transgenic plants than a wild-type confers that sore sequences are also useful as molecular markers for a quantitative trait e.g. root or gravitropism trait in molecular breeding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3111 ccarcacachadeachadeadachecritecheechadeerrehadeddeceirereer 3052

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

11 a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

                                                                                                                                                                                                                                                                                                           ò
                                          The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to be added to the present sequence was used to be added to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying at least one gene involved in plant resistance or response to pathogenic infection for conferring resistance or tolerance to a plant to bacterial, fungal or viral infection by determining or detecting plant gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GCTTGCTGACAAGTACGCGGCCGGCGCTGCCGCGCGCCGCTCCAGCCGAACAAGGGGGATCA 239

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (10) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which ach of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the resent in a culticaction of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for retional cuty discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. acruginosa. The present sequence is one of the target profit of the printed specification, but was obtained in electronic format directly from WIPO at

 The present invention relates to the cloning and sequencing of the gene cluster encoding a modular type I polyketide synthase (PKS) enzyme involved in the blosynthesis of the macrofide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a Streptomyces noursei nys2 DNA of nystatin PKS gene cluster
 New nystatin polyketide synthase polynucleotides and polypeptides, useful as antibiotics and antifungals.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid concluded are:

(2) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an action of inhibited by the antisense conjugeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) inhibiting cellular polyfestion or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (8) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent of product is overexpressed or underexpressed; (12) determining the extent of product is overexpressed or underespressed; (12) determining the compound that inhibits the compound that inhibits and organism. The arriens of compound that inhibits are useful for proliferation of an organism. The antisense nucleic acids required constitution of an organism. The antisense nucleic acids required constitution of an organism. The arriens of a compound that inhibits the confidence of the proliferation in cells other than S. aureus, S. typhimmurium, C. required for proliferation in cells other than S. aureus, S. typhimmurium, contined for promine or P. serveins of
 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to human acute neuronal induced calcium binding protein type 1 (ANIC-BP-1) ligand polypeptides and polymucleotides. Sequences of the invention are useful for treating human diseases including stroke, head trauma, multiple sclerosis, Parkinson's disease, Alzheimer's disease and spinal cord injury. They are also useful as vaccines. ANIC-BP-1 ligands are useful for identifying membrane bound soluble receptors. Polymucleotides of the invention are useful as diagnostic reagents, for chromosome localization studies, and as valuable tools for tissue expression studies. They are also useful in gene therapy. The present sequence is human ANIC-BP-1 ligand cDNA

1249 COGCGGCGGTGACGCCCAGCGCGGGGCCCGGCGCGCGCGCCCGTGGGCGAGCCGGT 1190
 The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ666813), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABB99207-ABP99562). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eventinomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both eventinomicin-type orthosomycins and avilamycin-type orthosomycins) regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin producted by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism

 The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding

 The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected blant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is bacterial, fungal or viral infection. The present sequence to a plant to illustrate the invention.

 The invention relates to an isolated ramoplanin biosynthetic pathway polypeptide selected from a polypeptide of open reading frames (ORF) 1- 32. The isolated polypeptides are useful for chemically modifying a biological molecule that is a substrate for a polypeptide encoded by a ramoplanin biosynthesis gene cluster, by contacting the biological molecule with the isolated polypeptide, where the polypeptide chemically modifies the biological molecule. The method comprises contacting the biological molecule with at least two different polypeptides encoded by ramoplanin ORFs 1-31. The polypeptides are useful for directing the biological molecule with at least two different polypeptides encoded by ramoplanin ORFs 1-31. The polypeptides are useful for directing the biosynthesis of the antibiotic ramoplanin in microorganisms. An isolated confinence cluster comprising the ORPs is useful for generating derivatives of the modified acid sequence is useful for generating derivatives of ramoplanin for impolation or for producing variants of other antibiotics of the peptide class. The isolated polypeptides are useful for synthesis of ramoplanin in vivo or in vitro, as an adenylation domain in conjunction with other peptide synthetase modules and allowing the
 Novel isolated ramoplanin biosynthetic pathway polypeptide useful for chemically modifying biological molecule that is a substrate for a polypeptide encoded by a ramoplanin biosynthesis gene cluster.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
 The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

 A fragment of the sequence comprising at least one of the cephalosporin biosynthetic enzymes listed in the KEYMONED can be cloned in a plasmid and used to transform microbes, such as bacteria or yeast. Although DNA is preferably isolated from L. lactamgenus, similar sequences could be obtained from other bacteria containing genes coding for biosynthesis of cephalosporin series antibiotics. See also AAQ10191-2. (Updated on 25-MAR-2003 to correct PA field.)

proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a blological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological or pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the sene or compound's activity; (11) a culture comprising strains in which the strain is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent of which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational card discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, cellud discovery programs. The present sequence is one of the target provaryotic sesential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in cells wince the printed specification, but was obtained in the printed profile sequences.

This sequence encodes a Zea mays cytokinin oxidase, ckx1. This gene is used to generate transgenic plants in which cytokinin-associated pathogenesis or growth behaviour is altered. Particularly applications include generation of plants with increased resistance to fungi and nematodes, increased grain yield and superior secondary growth properties. Host cells are used for production of recombinant ckx1 nucleic acid which is useful in an assay for determining cytokinin concentrations, and for its studying effects on plant growth and metabolism, including senescence

New cytokinin oxidase from maize - used to generate transgenic plants with, e.g. better disease resistance and growth characteristics.

 NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
 On Jan 16, 2003 this sequence version replaced gi: 26665814
 Length 224777;

protein, len: 1334 aa. Similar in parts to many
protein, len: 1334 aa. Similar in parts to many
regulators. Similar in the N-terminus to Streptomyces
collicolor SW.APSR STRCO (EMBL:D90155) regulatory protein
AfSR (993 aa), fasta scores opt: 524 z-score: 356.0 E():
1.9e-12 37.0% identity in 316 aa overlap. Similar in the
C-terminus to many other proposed regulators e.g.
Mycobacterium tuberculosis TR:053720 (EMBL:AL021931)
transcriptional regulatory protein (1085 aa), fasta scores
opt: 809 z-score: 541.8 E(): 8.3e-23 34.1% identity in 883
aa overlap. Contains a Prosite hit to PS00017
ATP(ATP-binding site motif A (P-10op). Also contains a
highly degenerate region also has a notably higher G
content (83.4%). Contains probable coiled-coils between
residues 867 to 904 (38 residues) and 1093 to 1121 (29
 COMPOUNT.

Submitted (14-NOV-2001) Takuji Sasaki, National Institute of Agrobiological Sciences, Rice Genome Research Program; Kannondai 2-1-2, Takukba, Ibaraki 305-8602, Japan (B-mail: tesaaki@mias.affrc.go.ip, URL: http://rgp.dna.affrc.go.jp/, Tel:81-298-38-7441, Fax:81-298-38-7468)
The muclocitde sequence of this BAC clone was generated by combining Monsanto and RGP-Japan Sequencing data.
NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the gaps between the are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a "working draft' sequence.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

Direct Submission
Submitted (01-JUN-2000) Lita Annenberg Hazen Genome Sequencing Center, Cold Spring Harbor Laboratory, 1 Bungtown Road, Cold Spring Harbor, NY 11724, USA
On Sep 6, 2000 this sequence version replaced gi:8134854.
 * NOTE: This is a 'working draft' sequence. It currently consists of 23 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 2; Gaps
 NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping droup. Purther information can be found at http://www.sanger.ac.uk/HGP/Chr6 RPS-886H7 is from the library RPCI-5 constructed by the group of Pieter de Jong. Por further details see http://www.choi.org/bacpac/home.htm
 as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, GARLY, Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at.
 23855 Adecedesechendendendendendendendenden Adecedendendendendenden 23914
 IMPORTANT: This sequence is not the entire insert of clone RPS-856471 th may be shorter because we sequence overlapping sections only once, except for a short overlap.

The true right and of clone RPS-85647 is at 75152 in this sequence. The true left end of clone RPS-51012 is at 74160 in this sequence. The true right end of clone RP3-495010 is at 2000 in this sequence. Location/Qualifiers

 Direct: Submission

Submitted (10-MAR-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 18A, UK. E-mail enquiries:
cambridgeshire, CB10 18A, UK. E-mail enquiries:
humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Marill, 2002 this sequence version replaced gi:1930430.
During sequence assembly data is comparated from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-etranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=

 Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; 1 (bases 1 to 208936) Brimates; Catarrhini; Hominidae; Homo. 1 to 208936) Briran, B., Linton, L., Nusbaum, C. and Lander, B. Uppublished
 * NOTE: This record contains 229 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will

 to add
 This DNA fragment includes certain preferred base sequences. The two respectively, the shorter sequences CGCAGTACT and GGCGCCTG. These shorter sequences CGCAGTACT and GGCGCCTG. These shorter sequences at least must be inserted between the Smal-Scal and Narl-Sall restriction sites. Actinomycetes spp. transformed with the DNA sequence of the invention can be used to screen for new antibiotiss effective in macrolide resistant bacteria. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 24-OCT-2003 to standardise OS field)
 9
 New gene which gives macrolide antibiotic resistance - has DNA fragment with specified base sequence.

 The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRUMs selected from target genes, coding and non-coding regions of RNMs corresponding to target genes, genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with no or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX557272-74. These multiple target oligonucleotides (specifically AAX5180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vesconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, pentreatic metastasses, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the party of a gene in an operon required for the gene product or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which a proliferation or the inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 93% identical with the novel human oDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and method of detecting polymucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of perventing, treating or ameliorating a medical condition; kits comprising polymucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the corresponding to the oDNA sequences of the invention are contig sequences corresponding to the oDNA sequences of the invention are contig sequences corresponding to the oDNA sequences of the invention are contig sequences or methods for the polypeptides encoded by the contigs (ADC3381-ADC3382-) and the polypeptides encoded by the contigs (ADC3381-ADC3382-) and the polypeptides encoded by the contigs (ADC3381-ADC3382-) and the polypeptides encoded by the contigs (ADC3381-ADC3381-ADC3382-) and the polypeptides encoded by the contigs (ADC3381-ADC3382-) and the polypeptides encoded by the contigs (ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-ADC3382-
 disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The mucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNs sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to the isolation of novel genes (ACF3446-ACF34559) encoding proteins (ABR64180-ABR64281) involved in the process of angiogenesis: The nucleic acid molecules are useful in identifying and/or obtaining full-length human genes involved in an angiogenic process. The nucleic acid molecule, polypeptides or complexes encoded, cells or genetically modified non-human animals derived from these are useful for the screening of candidate pharmaceutical compounds used in treating angiogenesis-related disorders. They are also useful for diagnosing, prognosticating or treating an angiogenesis-related disorder, which angiogenesis-related disorder, which can decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases such as decreased vasculature is of benefit (e.g. cancer, rheumatoid arthritis, diabetic retinopathy, psoriasis or cardiovascular diseases such as disorder in which an expanding vasculature is of benefit (e.g. ischemic limb disease or coronary artery disease). The modulator of expression or activity of the polypeptide encoded by the nucleic acid sequence is useful for manufacturing a medicament for the treatment of an angiogenesis-related disorder. This sequence corresponds to the gene encoding one of the novel angiogenic protein

The specification describes antisense oligomucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligomucleotides may be derived
from sequences AAX55272-74. These multiple target oligomucleotides
conditionally AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
conditionally vasoconstriction, inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, including lung
conditions and inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
conditions and cancers such as leukemias, lymphomas, carcinomas e.g.

 The invention relates to an isolated ramoplanin biosynthetic pathway colypeptide selected from a polypeptide of open reading frames (ORF) 1-32. The isolated polypeptides are useful for chemically modifying a biological molecule that is a substrate for a polypeptide encoded by a conjectule with the isolated polypeptide, where the polypeptide chemically modifies the biological molecule. The method comprises contacting the biological molecule with the isolated polypeptide, where the polypeptides chemically conjectule with the isolated polypeptides, where the polypeptides contacting the biological molecule with a least two different polypeptides encoded by ramoplanin ORFs 1-31. The polypeptides are useful for directing the biosynthesis of the antibiotic ramoplanin in molecule with a least two different polypeptides encoded by concording nucleic action error ramoplanin for improving production or for producing variants of other encoding nucleic action sequence is useful for generating derivatives of ramoplanin, for improving production or for producing variants of other antibiotics of the peptide class. The isolated polypeptides are useful for synthesis of ramoplanin in vivo or in vitro, as an adenylation domain conjunction with other peptide antibiotic precursor for modifying fatty acid incorporation of Thr into a peptide antibiotic preduction of an hydroxyphenylglycine (HPO)-containing peptide antibiotic, for production of an hydroxyphenylglycine ramoplanin products or its variants and derivatives, for enhancing production of ramoplanin products or its variants or derivatives, to chlorinate HPG of ramoplanin products or its variants or derivatives, to rehamining production of a ramoplanin products or its variants and derivatives, for enhancing mittorial entitibiotic precursor, and for designing special containing products or its variants or derivatives, to chlorinate HPG of a peptide antibiotic and isolating production of a ramoplanin products or its variants of a ramoplanin production of a ramoplanin production o

 The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ666813), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABP99207-ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eventionomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both eventionomicin-type orthosomycins and avilamycin-type orthosomycins) regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new orthosomycin natural products, not produced by the organism
 Identifying orthosomycin biosynthetic gene, gene fragment or gene cluster, by detecting presence of nucleic acid sequence corresponding to 17 of flambamycins protein families.

 The invention relates to identifying orthosomycin biosynthetic genes and its fragment/gene cluster (ABZ66670-ABZ66813), comprising detecting the presence of a nucleic acid sequence coding for a polypeptide (ABP99207-ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an eventinomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both everninomicin-type orthosomycins deviated essential the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin
 Identifying orthosomycin biosynthetic gene, gene fragment or gene cluster, by detecting presence of nucleic acid sequence corresponding to 17 of flambamycins protein families.

The present sequence encodes a murine ACDK (activator of cyclin-dependent kinases) 3 polypeptide. This sequence is corresponds to expressed sequence tag (EST) AIG06540. Human ACDK1 is localised to chromosome 10q23-10q24. ACDK polypeptides are predominantly localised within the muclei of cells able to undergo mitosis. In cells that do not undergo mitosis, ACDK proteins are found in the cytoplasm. The ACDK protein or polymucleotide is useful for regulating cell division, and for regulating cyclin dependent kinase. They are also useful for screening modulators of expression or activity. These are useful for modulating ACDK expression or activity in cells to regulate the progression of a cell through the cell cycle

The present invention relates to an isolated polypeptide of human PAS domain proteins (PASDP) PASDP gene is useful in gene therapy. PASDP is calso useful as an immunogen for preparing antibodies which are useful for diagnosing a condition of disease associated with expression of PASDP.

C diagnosing a condition of disease associated with expression of PASDP.

C PASDP is useful for treating cell proliferative disorder such as actinic keratosis, arteriosclerosis, bursitis, cirrhosis, chepatitis, psoriasis, and cancer including adenocarcinoma, leukaemia; developmental disorders such as renal tubular acidosis, Duchenne and cardiovascular disorder such as arteriovencus fistula, hypertansion, cardiovascular disorder such as atteriovencus fistula, hypertansion, cardiovascular disorder such as Alzheimer's disease, Huntington's disease, dementia, estroidosis, Goodpasture's syndrome, neurological disorders such as Alzheimer's disease, Huntington's disease, dementia, epilepsy, Parkinson's disease, mental retardation and cother developmental disorders of central nervous system such as Down's syndrome, cerebral palsy, periodic paralysis, mental disorders in syndrome, cerebral palsy, periodic paralysis, mental disorders in colluding mood, anxiety and schizophrenic disorders. PASDP is further useful for analysing proteome of a tissue or a cell type. PASDP is useful for creating knockin human disease and is further useful for generating a transcript image of a tissue or cell type, which represents the global crass to battern of gene expression by a particular tissue or cell type, and for human PASDP-2 cDNA

 involved in plant resistance or response to pathogenic infection. Millian comparises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.

The invention relates to purified/isolated polypeptides involved in synthesis of the warhead structure in enediyne compounds, or their fragments or sequences 75 homologous to them. The polypeptides comprise five families of proteins: PKSE [Golykeide synthase), TREC [thioseterase unique to enediyne biosynthetic locil, UNBL, UNBL, UNBV and UNBU (unique to enediyne biosynthetic locil, B and V). The proteins are isolated from 10 different micro-organisms. Also included are the nucleic acids encoding the proteins, antibodies specifically binding the polypeptides, and a computer system/computer readable medium comprising the sequences referred to above. The polypeptides and polynuclectides are useful in genetic engineering to design new enediyne biosynthetic loci. They can also be used to identify enediyne biosynthesis genes/gene fragments from samples containing genomic DNA e.g. in biomass from an environmental source (such as a mixed microbial culture/population of organisms), pure cultures or genomic libraries obtained from a mixed population of the enediyne warhead structure biosynthetic pathway. microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical handles into and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaccus DORR ORF6 DNA

 ô
 The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical handles into and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaceus DORR DNA

The invention relates to the gene cluster encoding the polypeptides responsible for the biosynthesis of the polyene antibiotic amphotericin (amph) of Streptomyces nodcaus. Polymucleotides of the invention are useful for preparing amphotericin derivatives or analogue antibiotic agents with altered properties and in the biosynthesis of polyketides other than amphotericin. amphorII, amphorII or amphorII are amphorII are are useful cor producing amphotericin derivatives glycosylated with alternative sugars; amphotericin derivatives glycosylated with alternative sugars; amphorII or amphorII gene sequences are useful in engineered biosynthesis of perosaminy1-i6-descarboxy1-i6-methyl amphoteronolide B; amphorIII or amphorII and perosaminy1-i6-descarboxy1-i6-methyl amphoteronolide B; amphorIII and perosaminy1-i6-descarboxy1-i6-methyl amphoteronolide B; amphorIII and amphorII or amphorII or apploach and amphore sequences are useful for preparing polypeptides capable of addition of mycosamine are nolyketide cher than amphoteronolide A or B or for preparing polypeptides for in vitro synthesis of GDP-mycosamine. The present sequence is S. nodosus amph biosynthetic gene cluster Novel cytochrome P450 enzyme and nucleotides encoding the enzyme, useful for preparing amphotericin derivative or analog antibiotic agent with altered properties, in biosynthesis of polyketide other than amphotericin.  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
 100 TCATCGCCGCCTGCCCCGCCATGCCGAAACACCGGGCCAGGATCACGTGCAGCACGCGA 159
 The invention relates to an isolated nucleic acid comprising any one of the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense aucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, or the activity of a gene in an operon required for

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding to polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or that has an activity against a biological pathway or required for proliferation, (7) identifying a compound that inhibits proliferation; (8) identifying a gene required for cellular proliferation of the best compound that inhibits proliferation of an organism acts; (8) manufacturing an antibiotic; (10) profiling a gene required for cellular proliferation of an organism acts; (8) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or the strains is present in a culture or collection of an organism. The antipular prolection of a compound that inhibits prolection of strains or (13) identifying the target of a compound that inhibits the collection of an organism. The anticense nucleic acids required to dentifying protecting or acceening for homologous nucleic acids required to dentifying protecting or solver and anticense and activity or activity or anticense nucleic acids required to dentifying protecting or acceening for homologous nucleic acids required to the contraction of an acceening for homologous nucleic acids required to acceening the page and activity or anticent or and activity or activity or acceening for homologous nucleic acids required activity or activity or acceening for homologous nucleic acids required activity or activity or acceening for ho

 rescandesceses de de la recese de consecue K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print directly from Fig. 1.

 The invention relates to a novel isolated nucleic acid molecule comprising a sequence that encodes a thioesterase or thioesterase domain, derived from a bacterial daptomycin biosynthetic gene cluster. The proteins of the invention have antibacterial, fundicide, virucide, antiparastic, immunomodulator, antilipemic, and cytostatic activity. The polynucleotides may have a use in gene therapy. The compositions and methods of the present invention are useful for generating novel linear and cytoic peptides and improving yield of a product in a cell expressing and adaptomycin non-ribosomal peptide synthetase (NRES) to be used as new compounds or in producing new compounds, such as antibiotics, antivirals, antiparastics, antimitorics, antitumour agents, immunomodulatory agents, anti-cholesterolemic agents, siderophores, agrochemicals and cytostatics. The sequence represents the 90kb region of the S. roseosporus daptomycin biosynthetic gene cluster

 The invention relates to a novel method for detecting the quorum sensing potential of a microorganism in a sample which comprises performing PCR using nucleic acids extracted from a sample containing at least one type of microorganism. The method may be useful for detecting the quorum sensing potential of a microorganism in a sample by amplifying a fragment of a lux gene or homologue. The current sequence is that of the minority luxl consensus sequence DNA of the invention.

 This invention relates to an immediate early herpes-simplex-virus type 2 (HSV-2) infected cell protein 4 (ICP4) recognised by human cytotoxic T cells. HSV-2 ICP4 protein is recognised by cytotoxic T-lymphocyte (CTL) cells in humans and is used in vaccines for therapeutically or prophylactically treating HSV infections. Pharmaceutical compositions of HSV-2 ICP4 protein may be used to treat patients suffering from HSV infections, to prevent or decrease recurrent herpes disease, frequency, exercity, and duration of episodes. The present sequence represents HSV-2
 82

 The invention relates to a composition comprising an expression vector bound to an aggregated protein-polycationic polymer conjugate or suspension. The expression vector contains a promoter polymucleotide sequence operatively linked to a polymucleotide sequence encoding an antigen which is a fragment of a gene or genome associated with an infectious disease, cancer and autoimmune disease such as rheumatoid arthritis, vasculitis, and multiple sclerosis, pathogenic genomes consisting of bacterium, fungus, protezoa and virus such as human immunodeficiency virus (HVV), herpes simplex virus (HVV), hepatitis C virus (HCV), influenza and respitatory syncytial virus (RSV), and cytokine expression vector), is useful for inducing an immune response (systemic and/or mucosal) in an organism. The cytokine expression vector contains a sequence for granulocyte macrophage-colony stimulating factor (GM-CSP) or interleukin-12 (IL-12). The polymucleotide sequences encoding the antigen and the cytokine are under transcriptional control of same or different promoter polymucleotide sequences. The expression vector and DNA vaccine is useful for treating a condition in an organism. The present sequence is human herpesvirus 2 complete DNA genome related to

 Grrdcccccccageceaccerdecegeccecageccearidcccaageccccccageag 152683
 cytokine expression vector), is useful for inducing an immune response (systemic and/or mucosal) in an organism. The cytokine expression vector contains a sequence for granulocyte macrophage-colony stimulating factor (GM-CSF) or interlukin-12 (IL-12). The polynucleotide sequences encoding the antiqen and the cytokine are under transcriptional control of same or different promoter polynucleotide sequences. The expression vector, as a DNA vaccine is useful for treating a condition in an organism. The present sequence is human herpesvirus 2 complete DNA genome related to the invention

 The invention relates to an isolated ramoplanin biosynthetic pathway composition of the invention relates to an isolated ramoplanin biosynthetic pathway composition isolated polypeptides are useful for chemically modifyling a biological molecule that is a substrate for a polypeptide encoded by a ramoplanin biosynthesis gene cluster, by contacting the biological composition of the properties of the piological molecule. The method comprises contacting the biological molecule with at least two different polypeptides chemically modifies the biological molecule. The method comprises contacting the biological molecule with at least two different polypeptides encoded by cramoplanin ORFS 1-31. The polypeptides are useful for directing the biological molecule with a least two different polypeptides encoded by composition of antibiotic ramoplanin in microorganisms. An isolated polypeptide contacting contacting production or for producing variants of other encoding nucleic acid sequence is useful for generating derivatives of ramoplanin, for improving production or for producing variants of other antibiotics of the peptide synthetase modules and allowing the incorporation of Thr into a peptide antibiotic precursor, for modifying fatty acid incorporation of Thr into a peptide antibiotic precursor, containing peptide antibiotic production of an hydroxyphenylglycine peptide antibiotic structure, for production of an hydroxyphenylglycine (PRG) containing peptide antibiotic, for enhancing fatty acid incorporation of the ramoplanin and derivative for enhancing fatty acid incorporation of the ramoplanian and derivative for enhancing fatty acid incorporation of the ramoplanian and derivative for enhancing fatty acid incorporation of the ramoplanian and derivative for enhancing fatty acid incorporation of the remaining and derivative and derivative for enhancing fatty acid incorporation of the remaining for the fatty acid incorporation of the remaining and derivative and derivative for enhancing fatty acid incorporation of the pep

The invention describes a method of screening a candidate antifungal compound for interaction with essential proteins (EP) or for modulation of EP activity e.g fungal gene transcribtion. The proteins tested in the invention include RPG34, POP3, TAR2, NAB2, MPT1, MTR2, BOS1, POL30, RSA2, SQT1, MTW1, TEB1, SPC98, BFR2, RNA1, GCD7, SKI6, NIP1, LCP5, NCE103, ECO1, ORC2, CRS1, FPD1, TIM10 and SFR4 from S. cerevisiae, C. albicans and human homologues. The method involves contacting a culture with one or more test compounds and determining the effects on the growth or viability of the culture of cells which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or modulate (preferably inhibit) activity of C. albicans EP. The inhibitor compounds identified by the method are useful for preventing or inhibiting fungal, particularly C. albicans growth in culture or in a mammal. The antifungal agents interact with essential fungal elements that can be used to treat fungal inferact with essential fungal elements preferentially killing the fungal but does not inhibit the biological activity of mammals of the fungal infection by preventing the growth and preferentially killing the fungal infection by preventing the biological activity of mammals of the fungal infection in the method of in the method of the contract with the method of the contract with and preferentially killing the fungal infection by preventing the protein contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the method of the contract with the contract with the contract with the contract with the contract with the contract with the contract wi

The invention relates to human polypeptides, termed NOVX, and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for diagnosing disease, and screening for potential therapeutic agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), arrioventricular canal defect, ductus arteriosus, pulmonary stenosis, subsortic stenosis, ventricular esptal defect (VBD), valve diseases, tuberous sclerosis, scleroderma, atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders, harbimer's disease, parkinson's disease, immune disorders, haematopoietic disorders, haemophilia, hypercoagulation, Crohn's disease and cancer. Sequences ABX72170-ABX72275 represent human NOVX

 The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the

 New gene useful for imparting resistance to plants and microbes to allow growth on acid soils comprises an aluminum resistance gene from
 This invention describes the novel aluminum resistance genes, aluA and aluB from Acidiphilum cryptum. These genes can be used for isolating regions that mediate aluminum resistance, from acidophilic, aluminum-resistant microorganisms. The products of the invention can be used to impart aluminum resistance to other organisms, particularly plants or microbes, especially to allow them to be grown in presence of aluminum normally toxic levels, e.g. in acidic soils. This sequence encodes the Acidiphilium cryptum AluA and AluB proteins described in specification

 This sequence represents DNA encoding a maize hydroperoxide lyase (HPL). HPL is a component of the oxylipin pathway, by which plants produce volatile allebydees in the oxylipin pathway, a fatty acid is converted to a hydroperoxy fatty acid by a lipoxygenaes, and the hydroperoxy fatty acid by a lipoxygenaes, and the hydroperoxy fatty acid is then cleaved by an HPL to yield a volatile aldehyde and an an interpretation and acid is then cleaved by an HPL to yield a volatile aldehyde and an an interpretation and are also contamination. They are able to inhibit fungal growth; in maize, high levels of volatile aldehydes correlate with the absence of aflatoxin contamination. Drotection against mechanical activity, and are implicated in protection against mechanical wounding (e.g., by insects). Certain volatile aldehydes, along with their corresponding alcohols, are responsible for odour of green leaves, and are also components of the remaise HPL nucleotide sequence is useful for enhancing disease resistance, modulating HPL expression and manipulating levels of flavour molecules in a plant cell for modulating levels of flavour molecules in a plant cell and for treating pathogen-mediated contamination of feed or food crops

Estimated insert size: 63251; sum-of-contigs estimation
Quality coverage: 37.55 in Q20 bases; sum-of-contigs estimation

* NOTE: This is a 'working draft' sequence. It currently

* consists of 22 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.
 Homo sapiens chromosome 19 clone LLNLF-200C8, WORKING DRAFT SEQUENCE, 22 unordered pieces.

Chasse, I
 NOTE: Betimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Gabbank draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 57 contigns. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
 Rat Genome Sequencing Consortium.

 linear HTG 21-MAR-2002
chromosome 6 clone
 Agrobiological Sciences, Rice Genome Research Program; Kannondai Jerskuba, Ibazaki 305-8602, Japan (B-mail: teasakianias, affrc.go.jp, URL:http://rgp.dna.affrc.go.jp/, Tel:81-298-38-7441, Pax:81-298-38-7468)
Tel:81-298-38-7441, Pax:81-298-38-7468)
The nucleotide sequence of this BAC clone was generated by combining Monsanto and RGP-Japan sequencing data.
NOTE: It currently consists of 1 contigs. Gaps between the contigs to be represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This
